## TOPIC: DATA HANDLING BASICS

*By*  
*Prof. Dr. Sourav Saha*

## DATA: EXPERT'S LOAN APPROVAL RECORDS

	A	B	C	D	E	F	G	H	I	J	K
1	Loan_ID	Gender	Married	Dependents	Self_Employed	Income	LoanAmt	Term	Credit History	Property_Area	Status
2	LP001002	Male	No	0	No	\$5849.00		60	1	Urban	Y
3	LP001003	Male	Yes	1	No	\$4583.00	120		1	Rural	N
4	LP001005	Male	Yes	0	Yes	\$3000.00	\$66.00	60	1	Urban	Y
5	LP001006	Male	Yes	2	No	\$2583.00	\$120.00	60	1	Urban	Y

Can we replace the expert by creating a model to determine whether a customer loan should be approved or not based on the expert's past approval records???

	A	B	C	D	E	F	G	H	I	J	K
1	Loan_ID	Gender	Married	Dependents	Self_Employed	Income	LoanAmt	Term	Credit History	Property_Area	Status
2	LP001002	Male	No	0	No	\$5849.00		60	1	Urban	Y
3	LP001003	Male	Yes	1	No	\$4583.00	120		1	Rural	N
4	LP001005	Male	Yes	0	Yes	\$3000.00	\$66.00	60	1	Urban	Y
5	LP001006	Male	Yes	2	No	\$2583.00	\$120.00	60	1	Urban	Y

## Types of Variable

### • Predictor / Independent

- Gender
- Married
- Dependents
- Self\_Employed
- Income
- LoanAmt
- Term
- Credit History
- Property\_Area

The value of status will be dependent on these variables.

### • Target / Dependent

- Status

This is what we are trying to determine.

	A	B	C	D	E	F	G	H	I	J	K
1	Loan_ID	Gender	Married	Dependents	Self_Employed	Income	LoanAmt	Term	Credit History	Property_Area	Status
2	LP001002	Male	No	0	No	\$5849.00		60	1	Urban	Y
3	LP001003	Male	Yes	1	No	\$4583.00	120		1	Rural	N
4	LP001005	Male	Yes	0	Yes	\$3000.00	\$66.00	60	1	Urban	Y
5	LP001006	Male	Yes	2	No	\$2583.00	\$120.00	60	1	Urban	Y

## Data Type

- **Character / String**
  - Gender
  - Married
  - Self\_Employed
  - Property\_Area
  - Status
- **Numeric**
  - Dependents
  - Income
  - LoanAmt
  - Term
  - Credit History

# Qualitative vs Quantitative Data

## Categorical Data

### Overview:

- Deals with descriptions.
- Data can be observed but not measured.
- Colors, textures, smells, tastes, appearance, beauty, etc.
- Qualitative → Quality

## Numerical Data

### Overview:

- Deals with numbers.
- Data which can be measured.
- Length, height, area, volume, weight, speed, time, temperature, humidity, sound levels, cost, members, ages, etc.
- Quantitative → Quantity

# Types of Data

## Quantitative

Data that can be measured with numbers, such as duration or speed

### Discrete

Whole numbers that can't be broken down, such as a number of items

### Continuous

Numbers that can be broken down, such as height or weight

### Interval

Numbers with known differences between variables, such as time

### Ratio

Numbers that have measurable intervals where difference can be determined, such as height or weight

## Qualitative

Non-numerical data that is categorical, such as yes/no responses or eye colour

### Nominal

Data used for naming variables, such as hair colour

### Ordinal

Data used to describe the order of values, such as 1 = happy, 2 = neutral, 3 = unhappy

# Scales of Measurement

<u>Data</u>	<u>Nominal</u>	<u>Ordinal</u>	<u>Interval</u>	<u>Ratio</u>
Labeled	✓	✓	✓	✓

Requires more storage

More difficult to  
manage and protect  
with legacy solutions

# UNIVARIATE DATA ANALYSIS – E.G. AGE, WEIGHT, SALARY

- Understanding central tendency: Mean, Median, Mode

Mean	Average value
Median	Middle value
Mode	Most frequent value

# MEAN

## **Mean**

*It is the sum of the value observation divide by the sample size.*

*The mean of the values 5,6,6,8,9,9,9,9,10,10 is*

$$(5+6+6+8+9+9+9+9+10+10)/10 = 8.1$$

## **Limitation :**

*It is affected by enormous values. Very large or very small numbers can distort the answer*

# MEDIAN

*It is the middle value of the list. It splits the data in half.  
Half of the data are above the median; half of the data are below the median.*

## **Advantage :**

*It is **NOT** affected by enormous values. large or small numbers doesn't make a impact.*

Median Odd	Median Even
23	40
21	38
18	35
16	33
15	32
13	30
12	29
10	28
9	27
7	26
6	24
5	23
2	22
	19
	17

# MODE

*It is the value that occurs most frequently in a data-set.*

***Advantage :***

*It can be used when the data is not numerical.*

***Disadvantage :***

- 1. There may be no mode at all if none of the data is the same*
- 2. There may be more than one mode*

Mode

# UNIVARIATE DATA ANALYSIS

- Understanding data Spread/Variability

Range	Difference between max and min in a distribution
Standard Deviation	Average distance of scores in a distribution from their mean
Variance	Square of the standard deviation
Skewness	Degree to which scores in a distribution are spread out.
Kurtosis	Flatness or peakness of the curve

# UNIVARIATE DATA ANALYSIS: RANGE

**Range:** defined as a single number representing the spread of the data

***Range* = maximum score — minimum score**

In order to figure out the range, A) arrange your data set in order from lowest to highest and B) subtract the lowest number from the highest number.

**A)** When arranged in order, 4, 6, 3, 7, 9, 4, 2, 1, 4, 2 becomes: **1, 2, 2, 3, 4, 4, 4, 6, 7, 9**

**B)** The **lowest number** is **1** and the **highest number** is **9**.

Therefore,  $R = 9 - 1 = 8$

# UNIVARIATE DATA ANALYSIS: MEAN DEVIATION

The mean deviation gives us a measure of the typical difference (or deviation) from the mean. If most data values are very similar to the mean, then the mean deviation score will be low, indicating high similarity within the data. If there is great variation among scores, then the mean deviation score will be high, indicating low similarity within the data.

$$MD = \frac{\sum |x_i - \bar{x}|}{N}$$

# Mean Deviation: An Example

Data:  $X = \{6, 10, 5, 4, 9, 8\}$

$$\bar{X} = 42 / 6 = 7$$

$\bar{X} - X_i$	Abs. Dev.
$7 - 6$	1
$7 - 10$	3
$7 - 5$	2
$7 - 4$	3
$7 - 9$	2
$7 - 8$	1

Total: 12

1. Compute  $\bar{X}$  (Average)
2. Compute  $\bar{X} - X$  and take the Absolute Value to get Absolute Deviations
3. Sum the Absolute Deviations
4. Divide the sum of the absolute deviations by  $N$

$$12 / 6 = 2$$

# UNIVARIATE DATA ANALYSIS: VARIANCE & STANDARD DEVIATION

**Variance** is defined as a number indicating how spread out the data is. **Standard Deviation** is the square root of the variance.

B8		$f_x$	=[E2+E3+E4+E5+E6]/COUNT(A2:A6)			
	A	B	C	D	E	F
1	No.of Items (N)	Observations(x)	$\mu$	$x - \mu$	$(x - \mu)^2$	
2	1	50	50	0	0	
3	2	55		5	25	
4	3	45		-5	25	
5	4	60		10	100	
6	5	40		-10	100	
7						
8	$\sigma^2$	50				
9						

$$s = \sqrt{\frac{\sum (x_i - \bar{x})^2}{N}}$$

# MEASURE OF CONSISTENCY

A large variance indicates that numbers in the set are far from the mean and far from each other. A small variance, on the other hand, indicates the opposite i.e more consistency

**BATSMAN A : 70, 80, 75, 90;**

**mean = 78; variance = 54; std-dev = 7**

**BATSMAN B : 25, 175, 85, 35;**

**mean = 80; variance = 3525; std-dev = 59**

**BATSMAN A is more consistent as the variance of his scores is less as compared to BATSMAN B**

# UNIVARIATE DATA ANALYSIS: COEFFICIENT OF VARIATION

The coefficient of variation (CV) is a relative measure of variability that indicates the size of a standard deviation in relation to its mean. It is a standardized, unitless measure that allows you to compare variability between disparate groups and characteristics. It is also known as the relative standard deviation (RSD).

$$CV = \frac{\text{Standard deviation}}{\text{Mean}}$$

A data set of [100, 100, 100] has constant values. Its **standard deviation** is 0 and average is 100, giving the coefficient of variation as

$$0 / 100 = 0$$

A data set of [90, 100, 110] has more variability. Its **sample standard deviation** is 10 and its average is 100, giving the coefficient of variation as

$$10 / 100 = 0.1$$

A data set of [1, 5, 6, 8, 10, 40, 65, 88] has still more variability. Its standard deviation is 30.78 and its average is 27.9, giving a coefficient of variation of

$$30.78 / 27.9 = 1.10$$

# EXAMPLE OF COEFFICIENT OF VARIATION

A Restaurant owner wants to open a new outlet. There are two territories to choose from. The choice mainly depends on the rental value, and the best option would be to open the restaurant in the territory that has lesser variation in the rentals.

<b>Territory A</b>	<b>Territory B</b>
Average Rental is around Rs 120,000	Average rental is around Rs 200,000
Standard Deviation is 2,000	Standard deviation is 3,000
<b>Co-efficient of Variation =</b> <b><math>2000/120000 = 0.016</math> or <b>1.60%</b></b>	<b>Coefficient of variation =</b> <b><math>3000/200000 = 0.015</math> or <b>1.50%</b></b>

The data available to us is as follows.

- (i) If you look at the rental values, Territory A seems to be a better bet as the average rental cost is considerably lower when compared to Territory B.
- (ii) However, it is not the right option because the variation in the rental values is lower in Territory B as compared to Territory A
- (iii) The CV of Territory B is 1.50% whereas the CV of Territory A is 1.60%
- (iv) **Thus, the better option for the restaurant owner is to open the QSR in Territory B.**

A lower value of Coefficient of Variation is preferable because of the lesser degree of volatility. Thus, the lower the CV, the better is the option.

# DATA VISUALIZATION

- Histogram
- Box Plot
- Scatter Plot

# UNIVARIATE DATA ANALYSIS

- Understanding data distribution: Histogram

## histogram

The height of the bar shows the frequency.

frequency distribution table

Number of Visits to the Library (score)	Number of Students (frequency)
1	4
2	5
3	8
4	9
5	3
6	1

frequency histogram

A bar graph has gaps between the bars.  
A histogram has no gaps between the bars.

A histogram is a graphical representation of the distribution of numerical data.

# HISTOGRAMS & CENTRAL TENDENCY

Use histograms to understand the center of the data. In the histogram below, you can see that the center is near 50. Most values in the dataset will be close to 50, and values further away are rarer. The distribution is roughly symmetric and the values fall between approximately 40 and 64.

# HISTOGRAMS & VARIABILITY

Suppose you hear that two groups have the same mean of 50. It sounds like they're practically equivalent. However, after you graph the data, the differences become apparent, as shown below. The histograms center on the same value of 50, but the spread of values is notably different. The values for group A mostly fall between 40 – 60 while for group B that range is 20 – 90. The mean does not tell the entire story! At a glance, the difference is evident in the histograms.

# BOX-PLOT

Boxplots are a standardized way of displaying the distribution of data based on a five number summary (“minimum”, first quartile (Q1), median, third quartile (Q3), and “maximum”).

# BOXPLOT: FIVE NUMBER SUMMARY

- Mean
- Median
- Quartile (Q)
- Minimum
- Maximum

Example: 5, 8, 3, 2, 1, 3, 10

If the data-set has an even number of values, the value of Q2 (**median**), will be the **mean** of the middle 2 values. The value of Q1 will be the median of all values to the left of calculated Q2 and the value of Q3 will be the median of all values to the right of calculated Q2.

Once the Five Number Summary values have been computed, finding the Range and Interquartile Range is easy.

$$\text{Range} = \text{Maximum} - \text{Minimum} = 10 - 1 = 9$$

$$\text{Interquartile Range (IQR)} = Q3 - Q1 = 8 - 2 = 6$$

# BOX-PLOT

**median (Q2):** the middle value of the dataset.

**first quartile (Q1):** the middle number between the smallest number (not the “minimum”) and the median of the dataset.

**third quartile (Q3):** the middle value between the median and the highest value (not the “maximum”) of the dataset.

**interquartile range (IQR):** 25th to the 75th percentile.

**whiskers (shown in blue); outliers (shown as green circles)**

**“maximum”:**  $Q3 + 1.5 \cdot IQR$

**“minimum”:**  $Q1 - 1.5 \cdot IQR$

# BOX-PLOT EXAMPLE:

99, 101, 236, 269, 271, 278, 283, 291, 301, 303, 441

$$\text{Median (Q2)} = \frac{1}{2} (11 + 1) \text{th term} = 6\text{th Term}$$

$$\mathbf{Q2 = 278}$$

$$\text{Lower Quartile (Q1)} = \frac{1}{4} (11 + 1) \text{th term} = 3\text{rd Term}$$

$$\mathbf{Q1 = 236}$$

$$\text{Upper Quartile (Q3)} = \frac{3}{4} (11 + 1) \text{th term} = 9\text{th Term}$$

$$\mathbf{Q3 = 301}$$

$$\text{Interquartile Range (IQR)} = Q3 - Q1 = 301 - 236$$

$$\mathbf{IQR = 65}$$

$$\text{Lower Limit} = Q1 - 1.5 \text{ IQR} = 236 - 1.5 * 65$$

$$\mathbf{\text{Lower Limit} = 138.5}$$

$$\text{Upper Limit} = Q3 + 1.5 \text{ IQR} = 301 + 1.5 * 65$$

$$\mathbf{\text{Upper Limit} = 398.5}$$

0	sunny	..		1	0	..
1	rainy	..		0	1	..
2	rainy	..		0	1	..
3	sunny	..		1	0	..

*OH encoding*

# CATEGORICAL DATA ENCODING: ORDINAL PLUS ONE HOT

# DATA ASSESSMENT

The first step in data understanding is a Data Assessment. This should be undertaken before the kick-off of a project as it is an important step to validate its feasibility. This task evaluates what data is available and how it aligns to the business problem. It should answer the following questions:

- What data is available?
- How much data is available?
- Do you have access to the ground truth, the values you're trying to predict?
- What format will the data be in?

# DATA ASSESSMENT

- Count the number of records — is this what you expected?
- What are the datatypes? Will you need to change these for a machine learning model?
- Look for missing values — how should you deal with these?
- Verify the distribution of each column — are they matching the distribution you expect (e.g. normally distributed)?

# DATA ASSESSMENT

- Search for outliers — are there anomalies in your data? Are all values valid (e.g. no ages less than 0)?
- Validated if your data is balanced — are different groups represented in your data? Are there enough examples of each class you wish to predict?
- Is there bias in your data — are subgroups in your data treated more favorable than others?

THANK YOU
